**Building heating** 

Agricultural process heat - Algae farming,

**Enge-Sande** 

35 °C

60 kW

- Extension building with 24 racks and 60 kW IT power on the Greentec Campus.
- On the roof of the data center is an algae farm (240 m²), which uses the waste heat directly.
- Waste heat at 35 °C heats the cultivation station and provides the comfortable climate for Chlorella and Spironella.
- Energy for the data center is generated 98% from wind power and the rest from solar and biogas power.
- Data center is certified according to EU standard EN 50600, VK3 and Blue Angel.
- A total of 60 kW of waste heat can be used and fed to the greenhouse above the data center through a flap control system.
- One kilogram of algae "consumes" about 2 kg of carbon dioxide.
- Data center offers co-location and cloud services.

#### **Business**

- Production of "Lüttge" nutritional supplements by Evergreen-Food GmbH.
- Novagreen has always looked for synergy opportunities, for example farmers (biogas plants).
- Combination with a data center, which provides just the right temperature, allows the extension of the harvest over the winter.
- With good cooperation, there is the prospect of expanding joint activities and developing additional areas.
- Total cost data center: 550,000 €.

## Communication

Wilfried Ritter: "The biggest challenge was and is to convince everyone that it works."

# **Campus Lichtwiese, Lichtenberg-Hochleistungsrechner**

## **Technology**

- Direct hot water cooling.
- Heat supply to own buildings by coupling the university's own district heating network and a high-performance computer with return temperatures of 60 °C.
- Heat pump is to provide 70 °C on the condenser side for the district heating network and at the same time cool the return water circulating on the evaporator side for server cooling from 60 °C to 50 °C.
- A 4<sup>th</sup> generation district heating network is to be created on campus.
- Demand for heating energy is to be reduced by 26 % from 2018.

## **Business**

• Funding in the amount of 15 million euros.

### Communication

In-Row-Cooling, Concrete core activation, near-surface geothermal energy

Bremen

Groundwater circulation with integral probes

Consultix

## **Technology**

- Data center location was former nuclear bunker.
- Use of near-surface geothermal energy (borehole up to 400 m deep) for cooling, constant water temperature at 12 °C.
- The patented integral probes use the principle of groundwater circulation. By using groundwater circulation, the ground is transformed into a cold reservoir. The ambient air outside the summer heat period serves as a cold source to regenerate the geothermal system.
- Continuous power 200 kW and peak power 800 kW through four independent circuits. In-row cooling systems are used in the IT rooms.
- At temperatures between 20 and 28 °C, the adiabatic recoolers on the roof step in. For every liter of water nebulized and evaporated, approximately 0.7 kW/h of additional energy is released for cooling. Above 28 °C, the geothermal cooling system then kicks in. If the ambient temperature falls below the threshold of 20 °C, the data center makes use of the free circulating air.
- In addition to air cooling, the building is also cooled and heated (with waste heat) via concrete core activation. Pipe registers are installed in the concrete, in which water circulates and absorbs or releases heat depending on the temperature.
- This energy concept completely eliminates the need for compression cooling and heat pumps.

## Data center at Wallotstraße 1 to 5, Dresden

50-60 °C

Hot water cooling, heat pump, buffer storage, district heating

In the building

Hot water circuit

Image source: [15]; Sources: [16–19]

**Building heating** 

Cloud&Heat Technologies GmbH, Wohnungsgenossenschaft Aufbau Dresden eG. Stadtwerke Dresden

- Liquid cooled (hot water cooling) data center with waste heat extraction.
- Most of the server waste heat is used directly for the hot water circuit.
- Copper pipes run through the server cabinets, through which water flows and heats up. The water heats up to between 50 and 60 °C and then enters a buffer tank. The heat is used for either water heating or heating.
- PUE value of 1.05 and in some cases a partial PUE value of 1.01.
- The "Energy Reuse Effectiveness" (ERE) is 0.62 during the use of heat pumps.
- Saving greenhouse gas emissions by reducing energy consumption and using waste heat to heat residential and commercial complexes. Underfloor heating systems are installed in the apartments.
- 20 server cabinets are located in the basement (underground parking) and heat a building with 56 apartments. The L-shaped new building at Wallotstrasse 1 to 5 extends over five floors and has smaller two- to three-room apartments for seniors and larger four- to five-room apartments for families. The server cabinets are fireproof and theft-proof and are located in a separate room in the underground parking garage.

## **Business**

- The computing and data storage power is sold to companies.
- The waste heat remains in the apartment building. Cloud&Heat sells the resulting heat to DREWAG, which, as the contractual partner and heat supplier of WG Aufbau Dresden, resells the heat to the building's tenants. If the computer waste heat is ever insufficient, the supply is ensured during peak load times via the district heating of the municipal utility.
- The investment starts at €60,000 for customers to switch to this system.

**Data Center Cologne**

evaporative cooling towers.

#### Other

• The data center is to serve as a test data center, or a real laboratory or experimental space, which makes it possible to test innovative technologies, products, approaches and services in a real data center environment.

Data center in cube form with a size of 27×30×22 m with six floors and an adjacent

Up to 12 MW of waste heat can be dissipated via adiabatic cooling using open

Circulated server room air is cooled down with water-flow heat exchangers in the rear rack doors, with their water circuit decoupled from the open cooling circuit by

Power consumption of the cooling system is less than 7 % of the electrical power of

a heat exchanger. This eliminates the need for recirculating air cooling.

the IT hardware (in conventional systems it is 50 to 100 %). Waste heat is also used to heat offices and cafeterias on campus.

Furthermore, the possibility is given to test, experiment, collect information and learn under real conditions. This allows research and development to be driven forward, new innovations to emerge and final products and technology to be adapted or developed.

Bugenhagen School

- Underground colocation data center (RZ-AKQ-HAM-02) with two floors, 200 m<sup>2</sup> area and space for 63 server cabinets.
- Free cooling is provided when the outside temperature is less than 12 °C.
- On top of the data center in Alsterdorf is a barrier-free three-field gymnasium for the Bugenhagen School. This is heated with part of the waste heat from the data center.
- Alignment of the system and technical rooms according to Green IT principles. PUE value of 1.25 at full load.
- 100% green electricity is sourced from wind and water power, solar radiation, biomass and geothermal energy.
- According to the company, this data center will be the first to use coolwalls instead
  of conventional recirculating air cooling units, which adapt their operating behavior
  to the load conditions of the IT rooms.

## **Communication**

 RZ-AKQ-HAM-02 and RZ-AKQ-NOR-01 - form a Twin Data Center in Hamburg and Norderstedt and together meet the TÜViT TSI 4.1 and EN50600 standards.

Direct connection

## New development area "Heinrich des Löwen"

## **Technology**

- From the data centre as a heat source, 250 kW of the waste heat with a temperature of 18 - 25 °C is decoupled.
- Spatial proximity to the heat customer (neighboring residential quarter with 400 houses and an expected heat demand of 2100 MWh/a).
- Heat pump (water-water) with 300 kW<sub>th</sub> and COP of 3.6 for temperature swing and use of carbon dioxide as refrigerant.
- Low temperature heat network with 70 °C.
- Peak load coverage and redundancy via the connection to the existing heating network in the event of a data centre failure.
- Expected primary energy savings of 1284 MWh/a and GHG savings of 304 t CO<sub>2</sub>/a.
- Heat network with a length of 3 km, transporting 4.2 GWh/a.

## Legal

"BS|ENERGY built an energy center that includes both a district heating connection and a connection to the cooling water circuit of the data center.

## **Business**

- Funding from the EU project "ReUseHeat".
- Investment costs of € 460,000 without the heat network.
- The turnover generated by the use of waste heat is € 330,000.

## Communication

Volkswagen received the "German Data Center Award" in 2019 for this idea.

## Other

Company wants to assume ecological responsibility → own environmental policy "goTOzero".

30 °C

High-performance heat exchangers, cool racks

In the building

Berlin

30 °C

Heinrich Böll Foundation, Basler & Hofmann

**Building heating** 

## **Technology**

- Energy consumption undercuts statutory values by half.
- Primary energy consumption after one year of adjustment of approx. 44 kWh/m<sup>2</sup>\*a.
- Ventilation via atrium, cooling by water evaporation, heating with server waste heat, optimal insulation.
- Photovoltaic system on the roof with 53,000 kWh primary energy contribution per year.
- In all offices, along the window fronts, there are so-called parapet units. They contain a high-performance heat exchanger. The parapet units only require a supply temperature of 28 °C for heating.
- Cool racks allow servers to be integrated into building technology and waste heat to be used directly; water with a temperature of 23 °C flows through the racks.
- Servers heat water to approx. 30 °C, which is fed into the heating system and heats
  office rooms.
- Cooling of servers in summer via adiabatic recooler.
- Natural ventilation through atrium inside the building, ventilation of the courtyard through the open atrium roof in summer. In winter, ventilation unit with heat recovery provides fresh air supply in the atrium. Waste heat is used as exhaust air to warm up the fresh air.

## **Business**

- Reduction of operating costs by approx. 18 %.
- Construction costs at approx. € 10.5 million with approx. 7,000 m2 gross floor area.

## Other

GeenCIO Award for cooling/heating concept.

**Building heating** 

Cloud & Heat

## **Technology**

- Original building from 1999 (former ECB data center) with a modernization of Cloud&Heat 2017/2018 to a Tier 3+ data center with the Cloud&Heat OpenStack public cloud infrastructure.
- Direct hot water cooling (50 to 60 °C) for GPUs and CPUs for a data center on 2 floors in the final expansion with 250 kW IT power/waste heat each. 90% of the waste heat from the data center can theoretically be used. Practically, due to the high drinking water temperatures in summer and the lack of heating load, 2/3 of it is delivered to the high-rise building (with a total of 31 floors) for space heating (Hotel Melía, hotel bar 22nd Lounge e& Bar and Bistro in the foyer, local office and conference rooms, hotel and gastronomy) and hot water, 1/3 goes unused via the façade to the surroundings).
- Existing ventilation systems with mechanical refrigeration (circulating air coolers) are available in the existing building, which take over the remaining 10 % air cooling. In addition, free cooling of the existing refrigeration systems can be used under suitable ambient conditions.
- In the first step, the heat is decoupled for heating purposes and, if there is a further cooling requirement, the free cooling is used first and then, if necessary, the mechanical chiller. For water cooling, however, 100 % free cooling is possible through a newly installed ventilation system with façade flaps, due to the temperatures of 60/50 °C even all year round and with small dry coolers and glass louvre façade openings.

### **Business**

- Cost savings in cooling of around €95,000 and €65,000 heating cost savings of 557 tonnes
  of CO<sub>2</sub> per year.
- Reduce operational costs by up to 50%.
- PUE of 1.014 according to its own data.
- According to Tech Tour, Cloud&Heat is among the 50 fastest-growing technology companies that are financed with venture capital, which makes it easier to finance.

### Other

"Master Plan 100% Climate Protection" (BMU), Frankfurt is one of the largest of the first 19 municipalities and is interested in creating a waste heat register in order to enable local usage concepts for waste heat.

Horeka - High performance computer Karlsruhe

## **Technology**

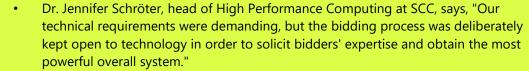

- Performance: 17 PFLOPS (FP64) with 22.4 GigaFlops/Watt.
- Computer system and energy-efficient hot water cooling comes from Lenovo and is based on Lenovo Neptune Direct Water Cooling (DWC) technology.
- Hot water cooling (cooling water throughput: 90,000 l/h), allowing year-round cooling with minimal energy use.
- In cold seasons, office rooms can also be heated with the waste heat.

## **Business**

• 15 million € supercomputer.

#

Hostway

- Waste heat from the data center is used to heat the surrounding office space, as well as commercial space in the neighborhood.
- 4,000 m<sup>2</sup> data center. Power supply of 4,000 W/m<sup>2</sup>. Data transmission per rack at several 100 megabits per second. No more than 4 kW of waste heat generated per rack.
- Location connected via Germany-wide fiber optic backbone ring and via own 2 Gigabit connection to branch offices in Frankfurt, Great Britain and Bucharest.
- Power supply via 10 kV system with 5 MW, 1,000 kVA transformer.
- UPS system with 720 kVA, two diesel generators with 1,000 kVA each.
- Room temperature of the data center regulated to 21 °C (± 2 K).
- Free cooling at low outside temperatures, chillers only switch on at certain outside temperatures.
- Plant pressurized floor air-conditioned.
- Racks are installed on raised floors in rows and according to the front-to-front principle, cold air with a supply temperature of 22 °C is fed in from the front via perforated raised floor panels and cabinet doors, warm air is extracted again behind racks via ceilings, cold air aisles and warm air aisles are clearly separated from each other.

## Communication

- Commissioning of the newest data center plant in 2007, constant adaptation to increasing requirements.
- Fifth data center under construction (as of 2008), principle of cold and hot air aisles is being consistently further developed, high-pressure cold air presses are not used.

## **LRZ**

**}**₌ 60 °C

Hot water-cooling circuit, adsorption chiller

9 3000 m

Water circuit

- Cooling capacity (hot water cooling) of 4 MW for cooling the SuperMUC-NG high-performance computers.
- Purely free cooling can be used all year round by means of water cooling.
- Waste heat can be used for building heating in cold seasons.
- Use of waste heat (1.1 MW) in warm seasons to generate process cooling with a Fahrenheit cascaded adsorption chiller (600 kW cooling capacity). This allows a total cooling capacity of 1.7 MW to be achieved.
- Cooling production by the adsorption chiller is used to cool the plate storage tanks.
- Direct hot water cooling is supplied by Lenovo (input: approx. 50 °C, output: approx. 60 °C).
- The first CoolMUC (since 2011) still required a heat pump.
- The new building, which was handed over in 2005, had the so-called building core
  temperature control for the institute and lecture hall building as the only after-use
  concept for computer waste heat. At least, the so-called static heating by district
  heating via radiators in the offices could be largely dispensed with, because the
  temperature control with > 21 °C in winter in the screed generally generates
  enough office heat.

## Communication

• Close cooperation between Fahrenheit and Lenovo Germany.

**Building heating** 

State of Mecklenburg-Western Pomerania, HWP Planungs-gesellschaft GmbH, GTB Berlin, dc-ce Berlin-Brandenburg GmbH, IBK Ingenieurbüro Küchler GmbH, European Union

**University of Hamburg** 

- Savings of 3,500 MWh of thermal energy and 1,000 tons of CO<sub>2</sub> per year.
- Cooling data center with water, heated water is led through pipe system via shaft and basement into Bundesstraße 45.
- Use of heat exchangers that transfer heat from water to supply air.
- Supply air is subsequently fed to university laboratories to heat rooms.
- Optimizations to controls planned for second year of operation to achieve 4,000 MWh of thermal energy saved.

#### **Business**

- Financing by climate fund of the city of Hamburg and financing model "Interacting".
- Funding from the Department of Energy, Climate and Agriculture.
- Money saved through lower electricity costs flows into funds through which new measures are financed (participation of the University of Hamburg since 2017).

**Building heating** 

University of Hamburg, German **Climate Computing** Center (DKRZ)

# **University of Stuttgart – High-Performance Computing Center Stuttgart (HLRS)**

**∷** 0 0 0 0

## **Technology**

- HPE Apollo (Hwak): Flagship supercomputer (CPU and GPU) of the Stuttgart High Performance Computing Center and one of the fastest computing systems in Europe (26 petaflops).
- Power consumption: max. power consumption per rack: ~90 kW; power consumption during normal operation; ~3.5 MW; power consumption LinPack operation: ~4.1 MW.
- Cooling: 6 distribution units for cooling (CDUs); water inlet temperature: 25 °C; water return temperature: 35 °C; water inlet temperature (ARCS cooling towers): 16 °C; water evaporation for wet cooling towers: ~9 m<sup>3</sup>/h.
- Since 2012, own buildings have been heated with two electricity-based heat pumps (heating capacity of 55 kWth each), which raise the temperature level of waste heat to a level that can be used for heating purposes. Approx. 96 % of the heat required for heating the HLRS buildings is covered by waste heat from the maximum power computer (max. 100 kW in winter). Approximately 270 MWh of heat is generated by this annually. The part of the waste heat that cannot be used is dissipated by free cooling. In high summer, district cooling is also used.

#### Law

- Certified: ISO 14001, 50001, EMAS, Blue Angel for energy efficient data center operations.
- Introduced environmental management system systematizes sustainability efforts and makes it an integrated part of the center

#### **Business**

- A comprehensive study has determined that the use of waste heat from HLRS to supply heat to the university campus is ecologically necessary and economically feasible.
- In the course of planning, possible variants will be further specified and prepared for implementation. The expansion of the infrastructure with supply channel and heat network, the further planning of the new construction project HLRS III and the buildings suitable for the use of waste heat will also be considered.

Direct connection cooling circuits

Image source: [79]; Sources: [80–82]

## **Technology**

- Recirculating air cooling units extract waste heat from the data center.
- NOVELAN brine-to-water heat pump with a heat pump capacity of 50 kW<sub>th</sub> at 22 °C heat source temperature.
- COP of 7.0 at 22 °C heat source temperature and 35 °C flow temperature.
- Heating of the company's own rooms (offices and workshop via heated ceiling), a total of 500 m<sup>2</sup> of heated floor space.
- Return flow from the cooling brine system flows into a 1,000-liter buffer tank. This serves as a heat source for the heat pump.
- There is a primary and secondary cooling loop to increase unit run time and prevent cycling of the chiller.
- A 2,000-liter buffer tank is integrated into the secondary circuit.
- Annual performance factor is 4.48 at a maximum system temperature of 55/45 °C.

#### **Business**

- With an electricity price of 18 cents per kWh, this results in a heat work price of 4 cents per kWh; significantly cheaper than standard heating operation of the overland center using natural gas condensing boilers.
- Natural gas savings of 100,00 kWh per year; saves 25 tons of CO<sub>2</sub> annually when using natural electricity.

Ed. Züblin AG, zafh.net, Biberach University of Applied Sciences, Fraunhofer Institute IBP, Federal Ministry for Economic Affairs and Energy

Building heating, Process heat - snow melting loop

## **Technology**

- Waste heat from the data center is used for the complete heating of the office building in combination with a facade in passive house quality (0.4 W/m²K). Energy transfer takes place in the office and meeting rooms by means of heating/cooling ceilings and in the stairwell with an underfloor heating system.
- Heat demand (4.30 kWh/m²a) of the building is so low that the waste heat is sufficient to keep the access road to the underground car park (approx. 200 W/m²) ice-free in winter.
- Data center has a cooling demand of about 200 MWh/a, which is mainly covered by free cooling. 2 chillers are available, one designed for heat pump operation and the other for cooling operation. In winter, the heat pump and the waste heat from the data center are used to heat the office building and completely cover the cooling demand of the data center. In the summer months, both chillers operate in tandem.
- Cold and hot aisle for server cooling. An electronic control system controls and monitors all the necessary components for refrigeration. The supply temperature in the refrigeration circuit is 19 °C, so that the air conditioning units can supply air at 20 to 22 °C directly to the racks. The existing warm aisle results in a warm air temperature of approx. 34 °C.
- CHP for peak load.
- Buffer storage for low-temperature heating (heat pump) to achieve high annual performance factors.
- Heating/cooling ceiling has a supply temperature of 29 °C and contributes to the high annual performance factor.

## 25 MVA Data center

Schwalbach am Taunus

25 MVA

Data Castle

## **Technology**

- First "Green Data Center" from Data Castle in Schwalbach with a capacity of 25 MVA.
- Co-location data center.
- Use of exclusively renewable energies and waste heat is fed directly into the district heating network.
- Installation of solar panels for power generation on the site.
  Planned PUE value of 1.25.

## **Business**

- Construction work to start in 2023.
- Completion of first construction phase and move-in of first customers planned for second half of 2024.

## Communication

• Property convinces with necessary infrastructure, waste heat concept can be realized.

The site belongs to the Frankfurt Availability Zone.

2 MW

**Building heating** 

AUDI Plant Planning/ Planning Energy and Building Technology, Audi AG, Drees & Sommer, City of Ingolstadt, Ingolstadt Municipal Utilities, Ingolstadt University of Applied Sciences, Fraunhofer Institute Magdeburg, incampus GmbH

## Technology

- Waste heat (approx. 2 MW, in the final stage 20 MW) from around 8,000 servers (Group data center) is used as heating energy.
- The waste heat from the IT servers is transferred via heat exchangers to the cooling water system, which serves as a heat source for waste heat utilization. If no waste heat is used, the data center independently cools the cooling water circuit to the required temperatures.
- Heat is extracted via a valve in the water circuit (between 22 and 30 °C). Excess waste heat is dissipated via air conditioning units and hybrid coolers.
- The Low-Ex network (DN800 DN600, pipeline length 3,000 m (9,100 in final construction), water capacity 1,220,000 l) consists of combined piping open in both energetic directions. The temperature ranges between 5 30 °C.
- Reversible heat pumps (flow temperature: max. 45 °C) in connection with surface cooling heating systems and supporting radiators are provided in the buildings.
- Heat pumps are designed to provide only 50 % of the necessary heating capacity (cover 80 to 90 % of the annual demand). The district heating network of Stadtwerke Ingolstadt is used to cover the peak load.
- With a capacity of 3,000 m<sup>3</sup>, both heat and cold are stored in the sprinkler extinguishing water tanks. In addition, the earth storage tanks with a capacity of 28,779 m<sup>3</sup> serve as heat storage.

#### **Business**

- Planned commissioning in the course of 2023.
- Joint venture between AUDI and the city of Ingolstadt.
- The development of the INCampus focuses on future-proof and sustainable concepts

   both in the construction of the buildings and in the energy supply of the technology park. The research campus serves as a trial for Audi to advance the energy transition worldwide.

## **Communication**

- Vision of a zero-energy campus.
- External consulting by IBM and minimizing the number of interfaces between the local heating network and the data center have contributed to a high level of acceptance among IT managers.

30 MW

Building heating, heat grid feed-in

Mainova Webhouse GmbH & Co. KG, Mainova AG, Batschkapp Cultural Center

- Data center area with 10,500 m<sup>2</sup> and an IT load of about 30 MW.
- High energy efficiency and supply exclusively with green electricity.
- Own photovoltaic systems on site.
- Greening of facade and exterior to contribute to sophisticated appearance, insulation and cooling.
- Use of waste heat from the data center to supply heat to the campus and nearby buildings.
- "Buildings feature optimal use of space for high computing power per square meter as well as ecological construction," says Mainova CEO Dr. Constantin H. Alsheimer.
- Two high-temperature heat pumps. Flow temperature of 75 °C.
- Dismantling of the original gas heating system and hydraulic connection with Batschkapp via a connecting line as an emergency supply.
- Heat demand of around 300 MWh/a.
- Simultaneous construction of a 110 m long pipeline.

#### Law

Meeting the sustainability goals of customers

### **Communication**

Fulfillment of the company's own sustainability goals

## Other

- No noise / odor emission nuisance
- Batschkapp customer converts heat supply on its own premises.
- Savings of 35 tons of CO<sub>2</sub> per year

## Equinix FR 4, FR 6 and FR 8

## **Technology**

- A low-temperature network is being planned. Within four phases, starting from the north, the center and the east of Griesheim are to be developed.
- Extraction of waste heat through heat exchangers and pumps in the network to consumers, current distance of two kilometers.
- Heating of buildings via local water pumps.
- In the final stage, data center should be able to supply around 56 MW of waste heat for a heat demand of 35-45 MW.

#### Law

Letter of intent that supports the free provision of waste heat for a longer period, with an option to extend.

### Communication

- · Start-up wants to design and implement low-temperature heating networks for urban heating in the city and region of Frankfurt am Main.
- Reason for idea is operator Equinix's many data centers on Lärchenstrasse.
- Idea also relevant for homeowners and tenants because of current concerns about energy and heat supply.

#### **Others**

· Three data centers already in place (FR4, FR6, FR8 (still under construction)) and more in the planning stage.

Frankfurt, Gallus district

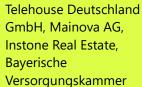

70 °C

Local heating network

**Building heating** 

- IT power approx. 35 MW, but continuous increase due to expansion on campus. Actual power consumption at approx. 20 MW, of which approx. 2/3 is pure IT power (approx. 14 MW).
- Spatial proximity of data center residential quarter (new building), construction of waste heat line from data center of Telehouse to main technical center: approx. 500 meters, expansion of district heating line: approx. 260 meters along Rebstöcker Straße, construction of local heating network in residential quarter: approx. 580 meters.
- Temperatures of local heating network: 70/40 °C, 2 large heat pumps with 320 kW<sub>th</sub> each, heat load and output of the district heating station of 3,210 kW<sub>th</sub>, annual demand 4,000 MWh/a of 1,300 new apartments, 3 kindergartens and commercial units; of which at least 2,400 MWh/a are to be covered by waste heat.
- Combination of data center waste heat (min. 60 %) and district heating (max. 40 %, generated among other things by waste incineration in the MHKW Frankfurt). The waste heat temperature is about 30 °C. In addition, there is a small buffer storage.
- Coupling of local and district heating network to ensure heat supply at peak load times. Max. Heating load residential quartier Westville 3.2 MW. Mainova heat purchase from Telehouse in winter approx. 500 kW plus 140 kWel for heat pumps results in max. 640 kWth. In summer, a heat demand of approx. 100 to 200 kWth, which means that the district heating network is not used at all.

#### Law

- Mainova contracting, 15-year contract term, Mainova plans and builds the technical systems, Telehouse commits to Mainova to supply this waste heat for 15 years.
- The energy supplier was granted access by the data center operator "to everything they install". Contract Telehouse - Mainova and Mainova - Instone is signed.

#### **Business**

- Willingness to cooperate with data center (security and free waste heat). Currently only profitable because the waste heat from the data center is provided free of charge.
- Completion of the overall project: 2025, phase 1 and first heat supply: 2023.

### **Communication**

- Openness and interest of the developers/investors as well as the data center operator.
- First project of this type and size in Germany.
- Savings of 440 t CO<sub>2</sub> per year compared to conventional heat generation.

#### Other

- Mainova has a sustainability strategy in its 2028 corporate strategy.
- Telehouse was extremely cooperative and signaled a willingness to decouple heat at an early stage.

**JH-Computers** 

**』** 30 °C

Water-cooled rack doors, adsorption chiller, CHP, Fresh water stations, buffer tank

Local heating network

\_\_\_\_\_\_\_1 MW

Stödtlen

95 °C

Building heating, Warm water

JH-Computers GmbH

- "Cumulus Computing" with 1 MW IT power and a PUE of 1.05.
- Power density of 40 60 kW per cabinet with 50 cabinets on 220 m<sup>2</sup>.
- Water-cooled rack doors.
- Use of PV on the roof, which is designed for maximum possible power. In addition, building shape is designed to achieve maximum PV yield and other PV systems are located on surrounding buildings. Remaining electricity demand is covered by biogas and PPAs for wind and solar. Thus, the data center is operated 100 % CO<sub>2</sub>free.
- Use of several combined heat and power plants, operated with biogas from the balance sheet, which on the one hand supplies electrical power for the data center operation and on the other hand uses the thermal power to drive n+2 redundant and modular adsorption chillers, which in turn cool down the chilled water. This results in a CHP system. In the maximum expansion, 3 to 5 CHP units are to be used.
- The adsorption machine has a heat pump operation. With the data center waste heat (30 to 40 % share) and the CHP heat, heat can be extracted at a temperature level of up to 95 °C.
- The room air temperature is a constant 22 °C for all servers. The return temperature of the cold water is between 23 and 26 °C.
- In addition, the waste heat generated will be decoupled and fed into a local heating network to be set up (construction to begin in 2023).
- In Stödtlen, with a population of around 2000, heating oil used to be the most important fuel for heat supply. Now the changeover to a warm local heating network is taking place and the initial connection rate is 60 %. Fresh water stations with small buffer tanks are installed in the households.

### **Business**

- A separate company is founded for the local heating network, in which the residents can also become shareholders.
- Compared to a "classic standard data center ", the annual operating costs can be reduced by about 66 %.

## **Communication**

• Most residents were convinced by the project, which is also evident from the high initial connection rate.

**nLighten Data Center** 

# **Technology**

- Use of heat from plant with 2.4 MW<sub>el</sub> capacity for district heating supply of GIZ-owned properties in Eschborn and the Wiesenbad of the city of Eschborn.
- Construction of 800 m long supply pipeline for connection between Edge-data center and Wiesenbad for transmission of hot water.

#### Law

• Signing of Memorandum of Understanding for the reuse of waste heat from the data center.

# **Communication**

- GIZ aims to use the project not only to reduce its energy costs, but also to promote sustainability initiatives.
- nLighten is also looking into heat recovery at its other ten German sites and says it is "already in discussions with municipal authorities and local stakeholders."

# Other

• "The ongoing digitization of the economy and the accompanying energy transition are creating an exciting opportunity to integrate data centers with local energy infrastructure," said Chad McCarthy, CTO at nLighten.

# Data center campus at the ICE train station

Patented watercooling systems, floor
heating

OVHcloud, PowerRZ
GmbH & Co. KG, Limburg
Energy Supply (EVL)

In the Building Leaving Building heating

**Q2 2023** 

# Technology

- Data center with a server capacity of 35,000 servers on an area of 10,330 m<sup>2</sup> at the Limburg ICE train station. The building occupies a gross area of around 4,500 m<sup>2</sup>.
- Commissioning is scheduled for Q2 2023.
- The data center will exclusively use water cooling systems developed and patented by OVHcloud itself, which combine high reliability with high energy efficiency. To increase redundancy and thus resilience, each server rack has its own double-redundant mini water loop system.
- With 2017 technology status, the water blocks can dissipate 200 W at a water temperature of 30 °C. Using the latest technology with laser-welded metallic base plates and covers, screws and glue can be avoided and the risk of leakage minimized.
- Electricity is sourced from the regional provider Energieversorgung Limburg (EVL) from 100 percent renewable sources.
- The data center is being built on a "greenfield" site, allowing the new facility to be tailored to OHVcloud's requirements from the outset.
- PowerRZ GmbH & Co. KG will take over the planning of the data center. Direct
  water cooling will not only be used to increase energy efficiency, but also for waste
  heat recovery. For the new building, the return flow from the server room cooling is
  used to heat the offices via underfloor heating. A green facade and a green roof
  are also used to compensate for sealed surfaces.

#### **Business**

- OVHcloud plans to invest an amount of around 100 million euros in the new data center over a period of five years.
- 25 new jobs will be created directly and an additional 20 indirect jobs.

Water circuit

# **Digital Park Fechenheim (former Neckermann site)**

# **Technology**

- When fully developed, 20 MW of waste heat for district heating supply, heating energy for around 3,600 households.
- In addition, waste heat utilization for local heating network is planned for around 18,000 m<sup>2</sup> of own office and storage space.
- Installation of several large industrial heat pumps in the listed boiler house on the Digital Park Fechenheim site to raise waste heat from the data center to the required temperature level for feeding into the district heating system.
- Construction of a new district heating line in the immediate vicinity of the Digital Park for connection to the grid.

#### Law

Signing of a memorandum of understanding for a joint project on the sustainable use of waste heat from data centers.

#### Communication

- Construction of data center campus with eleven new data centers.
- Feasibility study to examine whether waste heat from a data center can be fed into Mainova district heating network.
- "The cooperation with our partner Digital Realty will enable us to integrate data center waste heat into our district heating system for the first time in the future," says Mainova Chief Technology Officer Martin Giehl.
- First data center "FRA17" with state-of-the-art infrastructure already completed and handed over to operations.
- FRA18 is already under construction and will be completed in the coming winter of 2023. Construction of FRA27 will begin and will also be completed in the winter of 2023.

## **Communication**

## Other

- Construction of first building to begin in fall 2023.
- KMW says it is using synergies at the site to sustainably supply the buildings and is responsible for subsequent maintenance.
- KMW's operating site on the Ingelheimer Aue offers several advantages, such as power supply from KMW's renewable energy portfolio and good grid connections.
- Surrounding KMW power plants secure the emergency power supply.

Water cooling

In the Building

Low temperature network

卌 2023

Jülich

15 MW

**Building heating** 

Forschungszentrum Jülich, European High Performance **Computing Joint Undertaking** 

- · The computer, called "Jupiter", which stands for "Joint Undertaking Pioneer for Innovative and Transformative Exascale Research", will be installed in a purposebuilt building on the campus of Forschungszentrum Jülich from 2023. The Jülich Supercomputing Centre (JSC), whose supercomputers "Juwels" and "Jureca" are currently already among the most powerful supercomputers in the world, is planned as the operator.
- A major challenge is the energy required for such a large computing power. The expected average power is up to 15 MW.
- However, the future operators say that Jupiter is designed as a "green" computer and will be powered by green electricity.
- The planned hot-water cooling is intended to help the supercomputer achieve high efficiency values. At the same time, the cooling technology opens up the possibility of making intelligent use of the waste heat generated, for example by connecting Jupiter to the new low-temperature network on the campus of Forschungszentrum Jülich, just like its predecessor system Juwels. Other possible uses for Jupiter's waste heat are currently being investigated by Forschungszentrum Jülich.

#### **Business**

- The total cost of the system is 500 million euros.
- 250 million euros will be provided by the European supercomputing initiative EuroHPC JU and the other half by the Federal Ministry of Education and Research (BMBF) and the Ministry of Culture and Science of the State of North Rhine-Westphalia (MKW NRW).

Residential area "An den Eichen"

Germany

Local heating network

2024

Offenbach

Cloud HQ

**Building heating** 

# **Technology**

A non-evaporative heat rejection system was planned, with a PUE < 1.25.</li>
 Waste heat from the Evo data center is to be fed into the company's own district heating network, with an additional 9 MW of heat from new data centers to heat 1200 two-person households from 2024.

## **Business**

• 500 million euros total cost.

## Communication

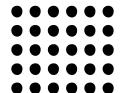

- The residential area "An den Eichen" was completed and connected to the local heating network before the data center. For a connection, the data center would have had to be built earlier. Possibly a swimming pool could be built nearby. A connection to Bürgel-Ost is considered realistic by some partners.
- Potential customer for the waste heat of the private data center: Samson Werk, since large demand for heat, but rather unlikely.
- Criticism of Cloud HQ data center because of land sealing, unused waste heat, large environmental impact from diesel generators for emergency power.
- Criticism led to better exchange between Cloud HQ and local agenda.

Vienna

82 °C

40 MW

**Building heating** 

Interxion, Floridsdorf Hospital, Wien Energie, **Austrian Government** 

# **Technology**

- The Interxion Campus consists of about 120,000 servers on an area of 22,000 m<sup>2</sup> with an IT connection capacity of up to 40 MW.
- From 2023, the Floridsdorf hospital will be heated by water heated by the Interxion data center with the help of heat pumps. Two heat exchangers in the technical center connect Interxion's cooling circuits with Wien Energie's waste heat recovery system. This is expected to save 4,000 tons/year of CO<sub>2</sub>.
- The hospital already has a heating circuit system with a pipe length of 90,000 m. Per year, 73.000 m<sup>3</sup> of hot water is used.
- The hospital should be able to meet 50-70 % of its heating needs with waste heat.
- The servers are cooled with air, which causes the cooling water to leave the server rooms at a temperature of about 26 °C. For the hospital, heat pumps are then used to raise the temperature level to as high as 82 °C. The temperature of the heat pump return is 16 °C on average and can be used for cooling the data center.
- The energy supply company Wien Energie installs three heat pumps (COP ≈ 4, output of 1 MW each) in the hospital's energy center. There, heat is taken from the cooling circuit of the data center and supplied to the heating circuit of the hospital with the help of the heat pumps. The heat is used in the hospital, while the cooled water is returned to the data center.
- The electrical energy requirements of the heat pump are covered, among other things, by an on-site wind turbine.

## **Business**

The Austrian government is paying EUR 3.5 million from the Environmental Fund for technical infrastructure between Interxion's data center in Louis-Häfliger-Gasse and the Floridsdorf hospital, which is located next door in Brünner Straße.

# **Communication**

Austrian Environment Minister Leonore Gewessler stressed that the project is part of the country's efforts to meet its energy needs through local production. She pointed out that a good way to do this is to use energy that is already produced in the country but is subsequently wasted.

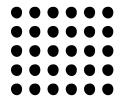

## Other

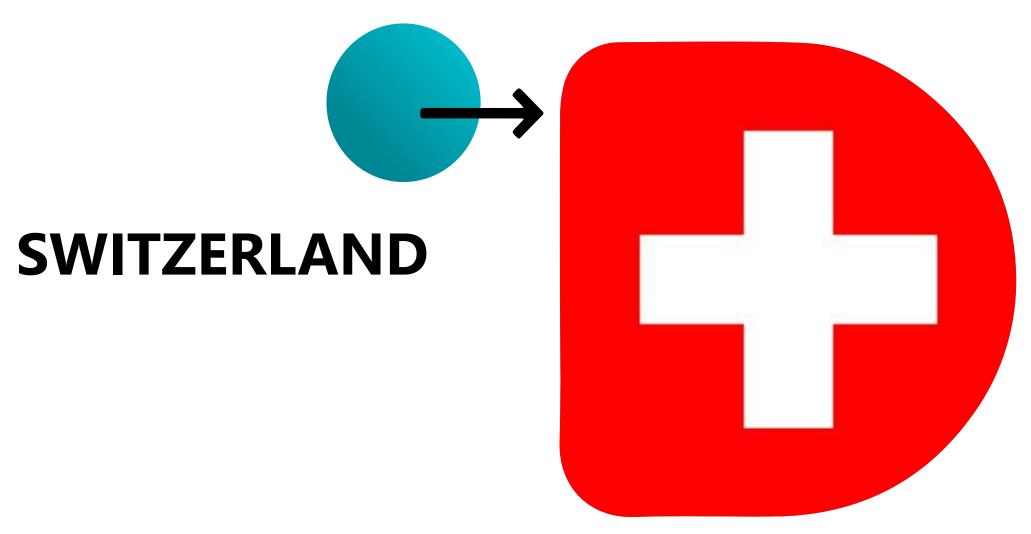

Project was chosen as the project of the month of environmental promotion in the country.

Process heat for pasteurization, building heating

St. Gallisch-Appenzellische Kraftwerke AG (SAK), St. Galler Stadtwerke, Bergkäserei Gais

# **Technology**

- Data center with 1.5 MW IT connection capacity and a PUE of 1.15.
- Facade and roof surfaces equipped with photovoltaic system, generates 230,000 kWh of electricity annually for data center.
- Adiabatic cooling (ServeCool units from Hoval) requires no mechanical chillers and operates in a climate-friendly manner through free cooling.
- Location 920 m above sea level saves cooling capacity due to colder environment.
- Rainwater collection for adiabatic cooling in Gais.
- Cross-flow plate heat exchanger with side length of 1.20 meters, size allows aboveaverage heat recovery. The heat exchanger area amounts to 1,200 square meters per ServeCool.

- Water is heated to 20 °C by waste heat, cheese dairy extracts energy, water cools
  down to 14 °C and flows back again. The neighboring mountain cheese dairy in
  Gais draws around 1.5 GWh of waste heat annually (decoupled waste heat output
  up to approx. 800 kW). Around 18 million liters of milk are heated annually with
  waste heat.
- High-temperature heat pumps still have to raise the temperature for cheese-making (up to 100 °C). Waste heat is also used for heating the building.

#### **Business**

 Hochverfügbarer, energieeffizienter Kommunikationshub, gleichzeitig auch Solarund Wärmekraftwerk.

#### Communication

- Pre-construction contact with neighbors in the upstream industrial area of the municipality and cantonal offices for close cooperation.
- Project met with great approval.
- In the next six years, 270 racks are to be rented out, utilization of approx. 90 % (as of March 2019).

# Other

## Data center has been certified at TIER IV level.

# Data center of GIB-Services (IBM) near Zurich for heating an indoor swimming pool

- Underground data center that can accommodate 300-500 customer servers on 200 m² at full capacity.
- According to IBM, it generates up to 2800 MWh of waste heat annually; at 8760 hours per year, this corresponds to just under 320 kW of continuous power.
- Use of heat exchangers to provide waste heat to a swimming pool.
- Excess heat is collected in a storage area, water is heated with it and directed to heat exchangers in the swimming pool.
- Heated water warms the pool water.
- Up to 130 tons of CO<sub>2</sub> per year are said to be saved here.

#### **Business**

- Provision of waste heat free of charge.
- Municipality assumed part of the connection costs.

# **ECO-Qube**

Switzerland

Heat pump

Dübendorf

**Building heating** 

NEST, Lande, SDIA

# **Technology**

- The "ECO-Qube" data center in NEST is simultaneously part of the IT infrastructure and part of the building technology.
- A field test with micro data centers in the NEST research building at Empa and at two other locations in Turkey and the Netherlands aims to explore the potential of heating buildings.
- Sensor data from individual IT components is accumulated in Big Data structures, helping to ensure that heat distribution within the facility is accurately recorded at all times. Artificial intelligence combines this data with airflow simulations so that cooling can be highly targeted. At the same time, the computing loads in the three test data centers in Switzerland, Turkey and the Netherlands are distributed so that all three facilities can be operated as energy-efficiently as possible.
- The three data centers will be integrated directly into the energy systems of the surrounding neighborhoods and will be powered by renewable energy wherever possible.
- For the data center in NEST, the electricity for operation comes from the photovoltaic systems of the NEST units and the mobility demonstrator move, among others.
- The waste heat from the data center is fed into the existing medium- or low-temperature network. In winter, it directly feeds the building's heating system and, throughout the year, also serves as a source for a heat pump that provides domestic hot water.

#### **Business**

• Server system is part of the EU research project "ECO-Qube", which investigates the integration of data centers into building systems and their energy-efficient operation.

## Communication

• The project, called "ECO-Qube," is supported by the EU's Horizon 2020 funding program and brings together research and industry partners from Switzerland, Turkey, Spain, Germany, the Netherlands and Sweden.

The project will last about three years. Once completed, the team aims to be able to provide guidelines for planners and building operators to help them integrate data centers into buildings and neighborhoods in an energy-efficient way.

- Heating and cooling are generated in a climate-friendly energy network.
- The primary energy source is waste heat from data centers, which is processed and made usable by large heat pumps.
- Supply to customers via piping networks for heating, water heating or cooling.

## **Business**

- Construction of an energy network with the aim of generating minimum emissions for heating and cooling and using unused waste heat from the data center in the energy network.
- High energy density and demand in the area between Glattbrugg station and Balsberg for heating and cooling.
- Energy network for district heating and cooling is worthwhile.
- Waste heat is used in summer by the energy center to generate heat.
- Customers also require heat in summer for operational processes, among other things.

#### Other

ATES, heat pumps

nearby

Underground river

Amsterdam

20 °C

14 MW

Building heating

Equinix, Universiteit van Amsterdam

# **Technology**

- Data center with 14 MW, which is utilized to 80 % all year round (PUE 1.19).
- Air cooling: inlet temperature 24 °C, server outlet temperature 34 °C, cooling water of approx. 18 °C. The cooling water heats up to approx. 30 C and is available for waste heat recovery. There are 4 independent ATES (Aquifer Thermal Energy Storage) systems installed, each with a cooling capacity of 2.5 MW.
- Cooling system: < 16 °C outside temperature: free cooling; > 16 °C: water atomization of the hybrid cooler; > 22 °C: ATES system is used. In summer, only the ATES system is normally in operation and in winter, free cooling is used as standard. Mechanical cooling machines are available for emergencies. In total, the operating hours of the ATES are about 2,000 h per year.
- At a depth of about 180 m there is an underground river which flows into the North Sea. The water has a temperature of 10 °C and is used for cooling purposes by the ATES system in summer. As a result of waste heat dissipation, the temperature in the hot well rises to 20 °C. There is a distance of about 200 m between the cold and hot wells. The water consumption of the ATES system is about 1,000 m³/h during operation.
- A nearby university campus of the Universiteit van Amsterdam uses heat pumps for heating the buildings, which in winter use as a heat source the water of the underground river heated to 20 °C by the data center. Due to the very low flow velocity of the water, it can be used as a seasonal heat reservoir.

#### Law

• There is an agreement between the data center operator and the university to use the waste heat. However, there are no obligations on either side. If the ATES were to fail, the temperature of the university's heat source would be only 10 °C in winter instead of 20 °C. This case should not occur, however, as any problems with the ATES can be fixed within a few hours.

# **Business**

- The waste heat is provided free of charge.
- This system is used in the same city at the AM4, AM5 and AM6 sites. In addition, the new MU4 data center in Munich will also have an ATES system.

## Communication

The company, which carried out the installation of the electrical components of the data center during its construction, is in parallel also responsible for the maintenance of the university's electrical systems.

# **Switch Datacenters**

Netherlands

40-60 °C

Direct water cooling

Woerden

**Building heating** 

**Switch Datacenters** 

# **Technology**

- Planned upgrade of switch data center in Woerden enables waste heat with temperatures of 40 to 60 degrees Celsius.
- Instead of cooling the servers with traditional room coolers like CRAH units, the cooling is done as close to the server as possible to get the highest possible waste heat temperature from the servers.
- DLC provides a much higher cooling capacity, which in most cases allows for higher power density in a much smaller footprint. This is advantageous for data centers in urban areas.

#### **Business**

#### Communication

- First data center in Europe to financially compensate its data center customers for waste heat recovery by using existing Direct Liquid Cooling (DLC) technologies to cool servers.
- Switch Datacenters believes that large cloud providers may be motivated by the
  financial incentive to switch to DLC or other high-temperature cooling. The
  company also wants to be an example for other data centers adopting the same
  strategy, which could also be very beneficial for the data center industry as a whole.

**Aalsmeer Energy Hub** 

**Netherlands** 

25 °C

Heat exchanger, cold local heat

1400 m

Water circuit

2024

**Aalsmeer** 

22 °C

4 MW

Building heating, process heat

- 4 MW data center.
- The data center is cooled with outside air as long as the temperature is below 18 °C, otherwise chilled water is used. The air is heated to about 25 °C and discharged.
- Waste heat is extracted and reused, and about 20 % of it goes to the IKC Triad school, the Fertiplant plant nursery, a swimming pool and a gymnasium called The Waterlelie.
- More waste heat could be used elsewhere, but the distance to other potential customers would make that difficult. Reinders said.
- The water is piped through a 1,400-m-long pipe (up to 25 m underground) and reaches customers at a temperature of 22 °C. Apparently, the project opted for deep drilling and horizontal directional drilling (HDD) because of the risk of encountering other pipes and possibly World War II munitions. Two non-insulated pipes (HDPE) with a diameter of 160 mm are used.
- After the water has given up its heat to the customers, it returns to the data center at a temperature of 12 °C, where it is used again for cooling. The pipe does not need to be insulated, which would have driven up costs because the water flows at a high speed of 1.5 m/s, Jeroen Roos of energy transmission company Infinitus told Reinders.

#### Law

There is a residential area nearby that could potentially use the waste heat from the data center, but this has not yet happened. Apparently, under the Dutch Heat Act, NorthC would have to fulfill supply obligations to supply residential consumers.

## **Business**

- · Aalsmeer Energy Hub transports hot water from the NorthC data center to customers such as a swimming pool, school, and nursery, which then use heat pumps to efficiently bring the water to higher temperatures.
- Fertiplant uses hot water year-round to heat its offices and planting areas and to clean plant roots. The company initially held on to its gas boiler as a backup but has since abandoned it.

**Data Center Bytesnet** 

Netherlands

Immersion cooling

Bytesnet Boston Ltd., WarmteStad

District Groningen

200 kW

**Building heating** 

- The energy from the waste heat emitted by the servers and IT equipment is said to be sufficient to heat more than 10,000 homes and businesses.
- According to Boston, the IT infrastructure consists of Supermicro server nodes combined with large DDN storage systems connected via Mellanox networks. The software layer uses vScaler, an HPC platform based on OpenStack that provides monitoring, management, job scheduling and message passing, and can automate processes to reduce management overhead and lower costs for Bytesnet.
- Cooling technology from Asperitas, specifically the AIC24 solution for 21-inch servers.
- Mainboards of the servers completely immersed in a dielectric fluid, dissipates heat by convection and keeps the system cool.

#### **Business**

• "This approach, developed by Boston, enables us to achieve unprecedented energy efficiency and significant savings in our upfront and operational costs - all while delivering a higher quality of service to meet the increased demands of data-driven businesses," said Jan-Joris van Dijk, managing director of Bytesnet.

# Interxion-Rechenzentrum AMS5

Schiphol-Rijk

Heat supply for

industrial estates

nearby

Heating network

2 M

Interxion, Polderwarmte

# **Technology**

Supplying residual heat to industrial estates in Schiphol-Rijk in the Amsterdam area.

## **Business**

- Estimated 45,000 GJ of waste heat for businesses.
- Savings of approximately 1.5 million m<sup>3</sup> of gas at project start-up, may increase to 75,000 GJ of waste heat and 2.5 million m<sup>3</sup> of gas savings five years after start-up.
- Interxion uses 100% green electricity, therefore a saving of 2,500 tons of CO<sub>2</sub> per year at the start of the project, increasing to 4,200 tons of CO<sub>2</sub> per year within 5 years

#### Communication

**E** 

In addition to the Interxion AMS5, Polderwarmte also plans to connect other data centers to the heating network, thus supplying heat to various buildings in Schiphol-Rijk.

## **Others**

This makes Interxion the first data center company in the Netherlands to supply waste heat on a large scale to business parks in the vicinity of its AMS5 data center.

# **Data Center in Val d'Europe**

France

Heat exchanger, natural gas boiler

4 km

Local heating network

Val d'Europe

48-55 °C

**Building heating** 

Dalkia, ADEME

- Data center with a heat output of 7.8 MW that can be extracted should be able to cover up to 90 % of the future heat requirements of the connected buildings. This includes the current water sports center and the future commercial area.
- Local heating network with a total of 4 km of distribution lines for heating surrounding buildings.
- Construction of future commercial area (in Bailly-Romainvilliers) in the immediate vicinity of the data center.
- Two heat exchangers in the data center, connected to the heating network.
- Natural gas boiler to increase temperatures on demand and for peak loads in case of high heat demand.
- Heat exchangers can deliver district heating water temperatures between 48 and 55 °C (approx. 7.8 MW).
- Heat loss of 20,000 MWh and emissions of 4,000 tons of CO<sub>2</sub> equivalent can be avoided annually.

#### **Business**

- Total cost estimated at €3.46 million, of which €1.0 million is supported by ADEME (French Agency for Environment and Energy Management).
- The probability that the project will be fully realized is increased by this sustainable energy recovery. This lowers the overall heat costs, and the heat prices are further favored by a reduced VAT.
- Since the data center is in operation all year round, heat prices are low and should remain relatively stable.
- Project start: 2013.

# Data center PA10 with roof greenhouse and swimming pool

- In phase 1, 3,775 m<sup>2</sup> of colocation space with 1,525 racks are to be built. When fully expanded, the number increases to 5,775 m<sup>2</sup> and approx. 2,250 racks.
- Use of waste heat to heat a local swimming pool. In addition, a 430 m<sup>2</sup> greenhouse is to be built on the roof, which is also to be heated with waste heat.
- In addition, the greenhouse has a hydroponic system, which is fed with collected rainwater. This reduces waste heat and wastewater emissions. The new data center PA10 will be built in accordance with international environmental standards, with the aim of obtaining LEED (Leadership in Energy and Environmental Design) certification. Equinix PA10 has set itself the goal of using 100 percent renewable energy and implementing various sustainability measures in accordance with ISO 50001.
- Temperature is maintained by heat exchangers connected to the data center's chilled water-cooling system.
- Additional sensors that monitor indoor and outdoor temperatures and humidity.
- Use of automatic sun protection, irrigation, and ventilation systems for year-round controlled climate.

#### **Business**

• Capital cost of \$163 million.

## Communication

Equinix aims to be globally carbon neutral by 2030.

# **Deep Green Data Center**

Exmouth Leisure
Centre

Exmouth

30 °C

28 kW

Swimming pool heating

- 28 kW system with HPC functions "digital boiler".
- Cooling by Deep Green's own immersion cooling tubs using mineral oil that captures heat and transfers it to the pool water via heat exchangers.
- The tubs contain Dell AMD Epyc single-CPU servers, each configured with four A100 80Gb PCIe GPUs and 4TB SSDs, according to Craggs (CTO Deep Green). The servers are installed in an "open chassis to ensure the most efficient heat transfer possible."
- Additional gas boiler to increase water temperature in case of emergency.
- About 96 % of the energy used by the computer is transferred and the pool's gas consumption is reduced by 6 2%.
- Data center is the size of a washing machine.
- The pool is heated to around 30 °C.

#### **Business**

- Deep Green pays Exmouth Leisure Center for all electricity used by data center and all facility costs and Exmouth Leisure Center receives heat free of charge.
- Deep Green offers to deliver, install and service the digital boilers free of charge, including the cost of connecting the pipes. The electricity they use is paid for in advance based on the hourly rate currently being paid by the customer.
- Energy costs for swimming pools have increased by 150 % since 2019, according to advocacy group UK Active.

#### Communication

- Use of waste heat to heat a 25 m long pool and a children's pool.
- The company would like to put a data center under "every pool," he said. "Companies that have green ambitions and want to support their local swimming pool are welcome to contact us."
- The technology could also be used in any business that requires heat, such as a bakery, distillery, or laundromat, adds Deep Green.

## Other

- Start-up plans to set up data centers at seven more pools in the UK, targeting 20 sites by 2023 due to high demand.
- Deep Green stands out because it gives off heat for free and is currently targeting an industry that could use a financial break.

**Supercomputer Center DTU** 

Denmark

Heat pump

District heating network

Risø

**Building heating** 

Danish Technical University (DTU)

- The Danish Technical University (DTU) Supercomputing Center in Risø has an area of 3,800 m<sup>2</sup>.
- Electrically operated heat pump uses the waste heat to raise water to the temperature level of the district heating network.
- District heating network supplies university buildings on campus with heat and hot water.
- Up to 600 kW waste heat from IT equipment is fed into the district heating network.
- Four months of the year heating is self-sufficient.
- Supercomputers provide 19 % of the total heat required.
- The heat pump feeds six times as much energy into the district heating network as the heat pump needs in terms of electricity to operate.
- Overall balance positive for the climate.

# **Data Center Danfoss**

- Internal use of waste heat in the company.
- Approximately 1 MW of waste heat from the data center is to be used almost entirely in the company (administrative headquarters, production, canteen, etc.). By 2024, around 25 % of the annual heating requirements of the approximately 250,000 m² factory and office area should be covered.
- There is a year-round need for process heat.
- There is a refrigeration system that should not be in operation, if possible, but serves as a backup. The heat is decoupled from the water circuit of the cooling circuit. Additional heat pumps are to be installed.
- The administration building was recently renovated and is equipped with surface heating. Some of the other buildings have different radiators.
- A photovoltaic system is installed at the Danfoss site, which takes over part of the power supply for the entire site. This means that the data center can be operated almost CO<sub>2</sub>-neutrally.
- From 2022, work at the site is to be completely CO<sub>2</sub>-neutral.

#### Other

• Full commissioning is expected in 2024. Not all buildings have yet been connected.

Finland

Liquid cooling, heat pump

District heating network

2021

Kajaani

**Building heating** 

Loiste Lämpö, CSC -IT Center for Science Ltd., EuroHPC, UPM Kiinteistöt, Vattenfall

- Waste heat from the LUMI data center (HPE Cray EX racks; 550 PFLOPS) will provide approximately 20 % of district heating in Kajaani, reducing the entire city's carbon footprint.
- The heat generated by the supercomputer (up to 60 GWh annually) is efficiently recovered through liquid cooling. The water temperature is then further increased by heat pumps to meet the needs of the district heating network.
- Between the high-performance data center and the heating network there is a heat pump that is operated with renewable energy. The heat network has a load of around 10 MW and supplies heat to the Renforsin Ranta Business Park and the city of Kajaani.
- The resulting data center has a negative carbon footprint as it is powered by renewable energy (100 % hydropower from Vattenfall) and its waste heat is used to heat local buildings. This reuse of waste heat will reduce the area's annual carbon footprint by 13,500 tons.

#### Law

According to an agreement, the data center, which will be operational in early 2021, will
collect the by-product heat, which Loiste Lämpö will then feed into its grid to heat
homes and businesses in Kajaani.

#### **Business**

- Loiste L\u00e4mp\u00f6 is currently developing a fully CO2-neutral district heating product using waste heat.
- This reduces total energy costs by up to 40 % and CO<sub>2</sub> emissions.
- Half of the financing for the project, which cost a total of 202 million euros, came from the EU and a quarter from Finland.

#### **Communication**

- "The location of an eco-efficient data center in Kajaani is the result of long-term negotiations between several partners. This is an important climate action that we are taking together with our customers and it will have a positive impact on the carbon footprint of the entire city. In addition, the project will create jobs in the Kajaani region," says Heikki Juntunen, CEO of Loiste Lampö.
- Winner of the 2021 Data Center Design Innovation Award.

Image source: [242]; Sources: [243–252]

## Nokia data center vLab

**Finland** 

Heat pump

District heating network

2022

**Tampere** 

95 °C

**Building heating** 

Uampereen Sähölaitos, Nokia

#### **Technology**

- From the beginning of 2022, the data center will feed waste heat into the city's district heating system.
- The Valtatie 30 commercial building in Tampere will be connected to the district heating system operated by the local utility Tampereen Sähkölaitos. The connection is made possible by improvements to the data center's cooling systems, which recently transitioned to HPE's Greenlake on-premises data center-as-aservice offering.

- The connection uses heat pumps from the Finnish company Oilon to increase the waste heat up to 95 °C.
- Heat pumps will provide around 50 GWh of heat each year.
- Excess heat from the data center can be used to heat 50 residential buildings per year.
- Building was already connected to the district heating network in 2016, but only since 2022 the heat can be sold because of the Greenlake upgrade, as it allows heat recovery from the liquid cooling system (installation with the help of engineering company Sweco).

#### Law

• Agreement with landlord Castellum.

#### Communication

 vLab is part of Nokia Software and works on research for areas like 5G. It has switched to a Greenlake Cloud-as-a-Service running on HPE hardware in the Valtatie 30 building. According to HPE and Nokia, this reduces energy requirements and makes the data center carbon negative by using renewable energy sources and liquid cooling with water from a nearby lake.

#### **Other**

• Finland has an ambitious goal of being carbon neutral by 2035 and Valtatie's owner, Castellum, is aiming for 2030. Nokia itself plans to become carbon neutral by 2040.

# Pitäjänmäki Data Centre

Finland

Microsoft, Fortum

Espoo, Kauniainen, Kirkkonummi

Building heating, hot water processing

Image source: [261]; Sources: [107, 262–264]

- Data center, which is operated with 100 % emission-free energy.
- The data center is expected to provide enough waste heat to cover around 40 % of the needs of around 250,000 district heating customers in the three municipalities (Espoo, Kauniainen and Kirkkonummi) and save 400,000 tons of carbon dioxide emissions annually.
- In a unique collaboration with Fortum Corporation, the waste heat generated in the data centers will be converted into district heating that supplies Finland's second largest city Espoo and neighboring Kauniainen and the municipality of Kirkkonummi. The waste heat processed for district heating, along with other measures, will help the city of Espoo and the surrounding communities meet their ambitious targets for reducing CO<sub>2</sub> emissions, which among other things will lead to the decommissioning of Fortum's last coal-fired heating block in Espoo.

#### **Business**

- The investment is a response to Finland's growing demand for powerful and sustainable computers and fast and reliable access to Microsoft services.
- Cooperation with the company Fortum for the use of waste heat.
- "Developing solutions to global challenges together with partners is a strategic priority for Fortum and we are proud to embark on this extraordinary journey together with Microsoft. By using waste heat from data centers, we can provide clean heat for homes, businesses and public buildings in the Finnish capital and save up to 400,000 tons of CO<sub>2</sub> emissions annually. This is an important and practical step towards a cleaner world," said Markus Rauramo, President and CEO of Fortum.

#### Communication

- "The decision to invest in a data center region that also supplies our cities [...] with surplus heat is a win-win situation. It will accelerate Finland's digital growth while making our energy system greener. [...]," said Sanna Marin, Prime Minister of Finland.
- "[...] In this unique collaboration, Microsoft and Fortum combine their world-leading
  expertise in cloud computing and sustainable energy solutions, transforming the
  design concept for the data centers of the future," said Cindy Rose, President of
  Microsoft Western Europe.

# **Equinix HE6 & HE7**

**Finland** 

Equinix, Fortum

District heating network

Espoo, Kauniainen, Kirkkonummi

**Building heating** 

**Heat Pump** 

## **Technology**

- In the initial phase, Equinix and Fortum's waste heat utilisation project is expected to have a heating capacity of around 4 MW and be able to cover the heating requirements of up to 2,000 private households per year.
- All Equinix data centres in Finland are already supplied with 100 % renewable electricity.
- Fortum cools Equinix's data centers and recovers the heat energy from the return water of the servers' cooling system. It raises the temperature of the heat to a level suitable for the district heating network and recycles the heat energy for distribution as district heating to customers in Espoo, Kauniainen and Kirkkonummi.
- The capacity of this concept can be increased to 6 MW in the coming years.
- Increasing the share of electricity-based recovered heat is an essential part of Fortum's goal of carbon neutrality in district heating in this decade.

#### Communication

- Equinix is increasingly looking to work with local community partners to recapture this warmth and support the communities in the neighborhoods where they operate.
- "We are delighted to be working with Fortum on this project. The project is the first of its kind in Espoo, and we are very pleased to be able to serve local households with our data centers in this way. Our cooperation with Fortum is another step towards our goal of being carbon-neutral by 2030 and a key part of our strategic sustainable development initiatives," says Sami Holopainen, Managing Director of Equinix Finland.
- "Our cooperation is ideal for both parties. Heat generated by cooling can be efficiently transferred to buildings connected to the shared heating network. At the same time, Equinix's data center carbon dioxide emissions decrease, and our customers, i.e., households, services, and companies, get competitive, clean, and reliable electricity-based district heating," says Timo Kivi, Sales Director of Projects in Fortum's Heating and Cooling Business.

# **DC1-Stavanger**

Rennesøy

m

20 °C

Fish farm

Norway

20 °C

Green Mountain, Norwegian Lobster Farm

## **Technology**

- The colocation data center DC1 is located in a former NATO ammunition depot and has a total area of 22,600  $m^2$ . The cooling capacity can be up to 2 x 26 MW (PUE < 1.18).
- Norwegian Lobster Farm is the first company in the world to produce plate-sized lobsters on a land-based fish farm. To grow optimally, the lobster needs a temperature of 20 °C in the sea water. This is the exact temperature of the seawater used to cool the IT equipment in Green Mountain's data center.
- In the DC1-Stavanger an innovative fjord cooling solution is used for this purpose. The seawater enters the data center at a temperature of 8°C. The data center then releases the water back into the fjord at a temperature of 20°C. The plan is to build a new production facility next to the data center. Here, the heated seawater can be used directly for lobster farming. This allows the energy to be reused and no complicated RAS technology ("Recirculating aquaculture system") is required.

#### Law

Norwegian colocation company Green Mountain and Norwegian Lobster Farm have signed an agreement to reuse data center waste heat in the world's first land-based lobster farm.

#### **Business**

- The agreement provides the farm with a constant supply of water at the lobster-preferred temperature of 20 °C, reducing the farm's costs and environmental footprint.
- There is potential to produce 900 tons of lobsters annually. The optimal temperature of the sea water reduces the time to market for plate-sized lobsters from 60 to 18/24 months. In addition, 360 tons of fish sludge are produced as "waste", which could be further processed in biogas plants.
- "In practice, this means that we can ramp up production. We can reduce technical risk and save both CAPEX and OPEX. In addition to the environmental benefits, of course," says Asbjørn Drengstig, CEO of Norwegian Lobster Farm.
- "Here in Rennesøy, which is sparsely populated, district heating is not a viable alternative. This project, on the other hand, fits like a glove. So we hope that we can extend this and similar concepts to our future facilities," says Green Mountain CEO Tor Kristian Gyland.

## **DC2-Telemark**

- Extension of RJU1-Rjukan, construction of 2-storey 20 MW building.
- Hima will set up an onshore trout farm in Rjukan. Only 800 meters from the trout farm is the DC2 Telemark. By connecting the two plants with a pipe system, Green Mountain can supply heated water to Hima.
- The heat exchanger technology then ensures that the Hima system can use the water's energy to maintain the correct water temperature for its RAS solution.
- DC-2 is near a hydroelectric power station.

#### Law

- Green Mountain entered into an agreement with Hima Seafood to recycle waste heat from the data center for the world's largest land-based trout farm.
- Hima Seafood and Green Mountain are both committed to minimizing the environmental impact of their operations and recognize that this project is a pioneering example of circular economy in practice.

#### **Business**

- Construction started in 2021 and when the plant is fully operational in 2023, the waste heat will be used to produce 9,000 tons of trout per year.
- €100 million (\$99.9 million) will be invested in the project and all waste heat from the new plant will be used by a nearby onshore fish farm.

#### Communication

- Sten Falkum, Executive Director of Hima Seafood: "Green Mountain's waste heat represents a significant cost savings in our production and we are excited that our heat requirements can help reduce Green Mountain's environmental footprint and in turn the data center to cool. This is really a win-win solution for both parties.
- Green Mountain CEO, Tor Kristian Gyland, adds: "Data centers are undoubtedly very energy intensive. Although our data centers are powered by 100% renewable hydroelectric power, we don't want to waste the energy. This project is a pioneering example of circular economy, at that benefits one company's production for another company and on top of that it's good for the environment. Our vision is to "set the green standard" and this project really supports that."

District heating

**Building heating** 

20 °C

Stack Infrastructure. Hafslund Oslo Celsio

#### **Technology**

- A custom heat exchanger system was installed on campus while the data center was upgraded with new insulated piping and cooling coils.
- The OSL01 data center exports around 3.5 MW of heat to the Oslo district heating system, which corresponds to an energy volume of around 25 GWh per year.
- Green electricity from Celsio is released for other purposes such as the electrification of the transport sector.

#### Law

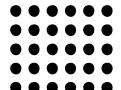

- Cooperation with energy supplier Hafslund Oslo Celsio with a contract for the supply of heat to 5000 apartments in the city.
- In return, Hafslund Oslo Celsio returns cold water to the campus.
- Meanwhile, in May 2022, Fortum sold its 50% stake in Fortum Oslo Varme, which is now 60 % owned by Hafslund Eco (Infranode and HitecVision each own 20 %).
- Celsio operates a 60-mile heat distribution network in Oslo.

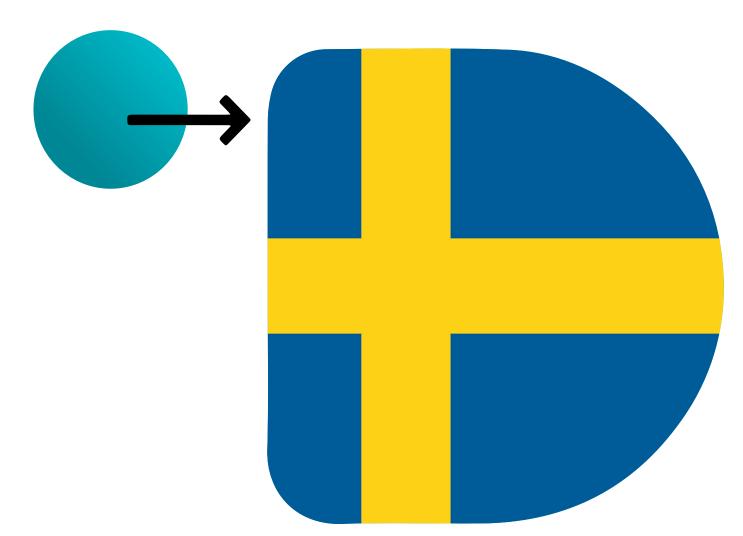

#### **Business**

There are other systems, but no partners who can take the excess heat.

#### Communication

- Cooperation with the heat supplier Hafslund Oslo Celsio.
- In 2018, Nordic data center operator DigiPlex announced it would work with energy supplier Fortum to recover heat from its campus in Ulven, Oslo, and use it to heat residential buildings. As part of the agreement, Fortum would return cold water to the campus.
- Knut Inderhaug, Managing Director of Hafslund Oslo Celsio. "Data centers in urban areas are stable and good sources of surplus heat for district heating, and together we can contribute to the reuse of zero-emission heat. Projects like this are positive for us as an energy provider, for our city and its residents, and for the climate."
- Halvor Bjerke, CEO, Stack EMEA Nordics, commented: "Heat reuse is now standard in our new data centers and we expect to continue working with city authorities, heat and electricity suppliers to ensure that this circular economy for energy is widely adopted so that the digital economy is sustainable."

**Building heating** 

Cloud&Heat Technologies, Vattenfall

- Two 20-foot containers (container construction), in which around 1,600 Nvidia graphics cards are installed. The included high-end servers are equipped for artificial intelligence (AI) and high-performance computing (HPC) applications. Overall, the output is 550 kW.
- Resource-saving IT operations are made possible by using the heat generated according to the "Combined Heat and Compute" principle. Direct water cooling (60/50 °C) allows excess heat to be used in the adjacent district heating system for maximum sustainability. The heat from the main IT consumers is transferred to the heating network without the involvement of heat pumps.
- There is a small heat pump for residual loads.
- The data center is located on the site of Vattenfall's biomass-fired district heating plant in Jordbro, south of Stockholm. Vattenfall's know-how and Cloud&Heat's technology enabled the construction of a water-cooled data center that does not emit any CO<sub>2</sub> during its operation and, moreover, is directly integrated into Vattenfall's heating network to reuse the heat," says Dr. Jens Struckmeier, CTO at Cloud&Heat Technologies.
- Up to 86 % heat recovery with a PUE of 1.04.

#### Law

- To protect the necessary infrastructure against unauthorized access, the cloud offering is equipped with additional security mechanisms from Secustack GmbH, a Cloud&Heat subsidiary.
- Vattenfall provides the infrastructure and the secure location, Cloud&Heat Technologies is responsible for operation.

#### Other

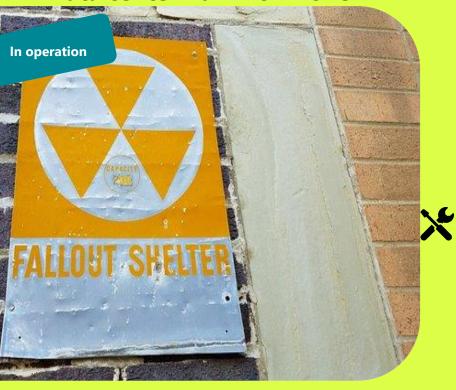

The aim of the pilot project is to win the first beta customers for the cloud offering, who will test the infrastructure and thus contribute to the further development of the service.

Heat pumps

67 m

District heating network

2014

## Technology

- Subsequent installation of two heat pumps connected in series and a heat pipe (67 m long, DN 125) from the data center to the Stockholm Exergi district heating network.
- he cooling capacity of the heat pumps is 694 kW and the heating capacity is 975 kW (COP = 3.47).
- There is a temperature control on the "cold" and "hot" side.
- In an emergency, the old chiller is activated.
- The heat pumps correspond to pressure class PN16 on the condenser side, so that they can be connected directly to the district heating distribution network. In normal operation, the heat output is around 600 kW at a temperature of 68 °C.
- 2x 61XWH0802 AquaForce units (<70 °C hot water).
- Heating control (Carrier Plant System Manager based solution with control solution developed by AdvanTE3 C).
- Providing 100 % system redundancy for server cooling in the data center thanks to the existing Carrier AquaSnap water-cooled system (two 30RWs) installed in 2013 which will act as a backup for the new system;
- Achievement of a "theoretical" PUE value of less than 1.0 if the hot water produced from waste heat were included in the PUE calculation.
- Plant oversizing to allow for increases in supply capacity and higher energy densities.
- Control of the system by regulating the temperature on the cold and warm side of the heat pump.
- In the event of a failure, the backup system consisting of old train station refrigeration machines kicks in.

#### **Business**

- In 2015, £35K was reported to have been raised over a three month period.
- Bahnhof has invested SEK 3.4 million in the new cooling system in Pionen, while Stockholm Exergi has invested SEK 1.3 million. This includes costs for heat pumps, pipes, hot water connections, wiring, control systems, insulation, installation and a new supply line to the existing district heating network.
- Sale of excess heat through Stockholm Exergi's Open District Heating. Amount of remuneration at the station depends on outside temperatures.

# Other

# **Data center Bahnhof Thule**

Sweden

Heat pumps

District heating network

Stockholm

68 °C

**Building heating** 

Fortum, Bahnhof, Stockholm Exergi

- · Three data center halls with a total of three heat pumps (carriers) connected in series.
- The heat sink is the district heating network.
- The total cooling capacity is around 1,200 kW if district cooling is supplied at 5.5 °C (cooling water temperature) and district heating at 68 °C.
- The heating output corresponds to around 1,600 kW. At outside temperatures of down to 0 °C, temperatures of 65 °C are required in the flow line, at lower outside temperatures higher flow temperatures are required, up to 100 °C at -18 °C outside temperature.

- Cooling also works without heat extraction and adapts to the heat requirement.
- In normal operation, heat pumps use the return line of the district heating network and cool down to the desired temperature for use in the data center.
- System can operate without District Cooling if there are interruptions in District Cooling supply.
- When the outside temperature is at least 20 °C, the refrigeration system produces refrigeration at full capacity, excess refrigeration energy is made available to other district cooling customers in the network system.
- If the outside temperature is below 20 °C and there is a cooling requirement, the chillers run at a lower capacity so that the Thule train station can cover its cooling requirements.
- There is a permanent need for heat in the city.

#### Business

- Price depends on environmental conditions and demand.
- The excess heat from the heat pumps in the district heating network is mainly used when the outside temperature is below 7 °C, which is around half the year.
- Bahnhof has invested a total of SEK 5.3 million in the cooling system, which includes three heat pumps (which are pressure class PN16 on the condenser side, so they can be connected directly to the district heating distribution network), piping, wiring, control systems, data collection and installation. Stockholm Exergi has invested SEK 2.6 million in new district heating and cooling supply lines.

Immersion cooling

DTM Group, Boden Business Agency

4.4 MW

2

Greenhouse temperature control, wood drying, rearing of temperaturesensitive feed animals

Boden

- Two existing pods with an output of 2.2 megawatts (MW) were supplemented by two more with an output of 2.2 MW. With CPUs that are now around 20 % more powerful, the computing capacity can now be realized with significantly fewer servers.
- With the expansion, the DTM Group is intensifying its research activities around the
  topics of immersion cooling and waste heat utilization in the data center. The
  company wants to test a total of four concepts for "Novec"-based immersion
  cooling in the new part of the data center and bring them to series maturity. Hybrid
  concepts, in which only performance-intensive components such as CPUs are
  immersion cooled and the power supplies continue to use air cooling, are also
  being researched.
- In cooperation with the Boden Business Agency, the Swedish partner of the DTM Group, practical usage scenarios are to be set up on the newly acquired area. This includes, for example, the cultivation of plants in a greenhouse that is tempered by the waste heat, the drying of wood or the rearing of temperature-sensitive feed animals. In order to ensure a constant air temperature, the exhaust air must be treated with an air box, which allows the admixture of outside air

#### Other

 According to DTM, the data center works completely autonomously and is monitored with an Al-supported DCIM solution. The electricity for the operation of the data center is regenerative and comes from a nearby hydroelectric power plant.

## **EcoDataCenter**

- 2 MW data center with PUE = 1.15 and 100 % renewable energy.
- Customized cooling system and heat dissipation into the local district heating network.
- Heat supply to residential and commercial properties (approx. 95 % of the city) and a local wood pellet factory (for wood drying).
- Link to the city's CHP plant (combustion of wood waste in a thermal power plant).

#### Communication

Other

Joint project between a local energy company and the operator of the data center.

- According to the company, it should be the first climate-positive data center.
- It is a pilot project. A second data center is planned on the same basis with 6 7 MW.

50 °C

Liquid cooling, solid oxide fuel cells

Heat recovery circuit

Luleå

35 °C

Air preheating fuel cell

RISE (Research Institute of Sweden)

- Small data center powered by fuel cells. At the Luleå site, the data center and the fuel cells were housed in two containers stacked on top of each other. The fuel cells, which are operated with locally generated biogas (polar gas), are located in the upper container. The lower container contains a liquid-cooled unit and the data center, which is supported by an uninterruptible power supply.
- The system works with solid oxide fuel cells (SOFC, Fab. SOLIDpower), which
  generate electricity from biogas. They work at high temperatures of around 600 °C
  and are therefore a particularly efficient variant of combined heat and power
  systems, as the waste heat can be used well for heating and cooling.
- There is a smaller heat recovery circuit inside the two containers. The heat generated by the submerged liquid cooling tank inside the data center container is used to preheat the air entering the fuel cells.
- The return water temperature from the cooling manifold unit in the Submer is approximately 50 °C. The fuel cells consume air at an optimal temperature of 35 °C, so the outside air (-25 to 25 °C) can be heated by the heat from the Submer system.
- The CHP should decouple heat with a temperature of 90 °C and in winter at -20 °C outside temperature the flow temperature is increased to 110 °C.

#### Other

RISE is a partner in the EU-funded WEDISTRICT project, which aims to demonstrate
that district heating and cooling networks can be built using a combination of
renewable energy sources and heat recovery solutions.

City Stockholm Business Region, Fortum Värme, Stockholm Exergi, Ellevio, Stokab, Ericsson

Stockholm

Building heating, district heating supply

10 MW

85 °C

**i** 2021

## Technology

- 10 MW data center can heat approx. 20,000 modern apartments, with the annual district heating requirement being 12 TWh.
- The objective of the Stockholm Data Park (SDP) is to cover 10 % of the heat demand in Stockholm. For this purpose, 20 MW from data center are to be fed in from spring 2021. This is intended to heat 35,000 apartments.
- There has been a district heating network in Stockholm since the 1950s. There are 2,800 km of pipelines in the city, and every house has a heat exchanger.
- Heat pumps raise the temperature level to around 85 °C.

#### **Business**

- In Sweden, electricity costs are the lowest in the EU and specific CO<sub>2</sub> emissions are low.
- Efforts are made to ensure independence from subsidies and market viability from the outset.
- Some companies prioritize ROI while others accept lower revenues.
- Business model: With Open District Heating, data centers, supermarkets, etc. can sell their waste heat to the energy supplier via a kind of open marketplace. It is comparable to a stock exchange, where the price depends on many factors (demand, temperature level). Depending on the situation, the supplier can decide whether he wants to feed in.
- Ericsson operates a data center in the SDP and the reason for heat extraction was to reduce operating costs and increase sustainability. Energy consumption and operating hours of the cooling could be reduced.
- Exergi's goal is a 100 % renewable heat supply.

#### **Communication**

- Initiative by the City of Stockholm, district heating and cooling provider Stockholm Exergi, electricity network operator Ellevio and fiber optic provider Stokab, which offers greenfield sites for data center construction.
- The district heating provider Exergi actively approached the heat sources, especially the data center, and informed them about the possibility of heat extraction for heating purposes and the simultaneous reduction of cooling costs. Another argument was that from a thermodynamic point of view, heat pumps and coolers function in the same way, with the cooler only dissipating heat to the environment.

#### Other

• Due to the geographic location, there is an increased need for heating.

# **Elementica**

**Building heating** 

- The heat recovery system at the Westin Building Exchange delivers up to 5MW of waste heat from the data center to an Amazon campus, saving 75 % of energy. Area of 38,000 m<sup>2</sup> is heated.
- The heat harvesting concept is based on an EcoDistrict approach with underground pipes, heat exchangers, heat recovery chillers and water storage tanks.
- The waste heat from the data center is absorbed via the cooling water circuit and piped to the Amazon campus, where heat recovery chillers use the heat to heat the company campus. Cooled water is piped back to the Westin building.
- In front of the EcoDistrict, the Westin Building released excess heat to the atmosphere.
- The data center uses the virtual cooling tower to remove heat and reduce water consumption and the use of cooling compressors.
- Over 20 years, the Westin Building Exchange's heat recovery system will save 180 million kWh of energy and avoid 650 tons of CO<sub>2</sub> emissions.

#### Law

- Largest combined energy system in the US that crosses property lines. The data center and the Amazon campus are located in two different buildings, which are separated by a street.
- Edo operates the Seattle EcoDistrict to over optimize shared energy opportunities and building performance.
- The City of Seattle was a key partner in the EcoDistrict project, helping to clear the way for the hot and cold water lines to run under the street as a standard utility facility.

#### **Business**

- Annual energy and operational savings of \$240,000.
- Efforts result in tangible energy and cost savings for all stakeholders the Westin Building Exchange, Amazon, the EcoDistrict facility owners and the local utility.

# **Wyoming Hyperscale White Box**

USA

Immersion cooling

Opposite side

Geothermal aquifer

Wyoming

130 MW

Indoor-Farming

Kay Thornock & Sons

- IT power capacity totals 130 MW. The 1st construction phase comprises 30 MW.
- The first construction phase covers around 235,000 m<sup>2</sup>. A total of around 2.6 million m<sup>2</sup> belong to the project.
- The entire data center is designed from the start for immersion cooling with submersible systems. In this way, almost all of the waste heat can be recycled. A power density of 80 kW/rack is achieved with immersion cooling.
- Immersion cooling for extreme density, efficiency and sustainability.
- Geothermal aquifer for heat exchange with the help of aquifer.
- Hot water is routed to Indoor Farm (another Thornock Clan subsidiary) and then returned to aquifers.
- The site is located in the inhospitable mountains of Wyoming, with a total of 500 MW of renewable electric power around.
- It consists of five wind farms and a 58 MW solar farm, which will supply the facility with operational power. They were built independently of the data center park and do not bother anyone in the wasteland. The data center park also uses geothermal energy.
- Expected PUE of 1.08 and water use efficiency of 0.0 at resiliency level 3.

#### **Business**

• Customers who generate particularly high calorific waste heat receive a credit.

#### **Communication**

- CO<sub>2</sub> impact tracking.
  - Further data center projects planned in Tuscon and Phoenix.
  - Goal: regenerative data center.

#### Other

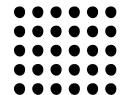

- Location chosen for fiber optic expansion opportunities, hub for data centers, good access to renewable energy from nearby wind and solar farms.
- Still under construction.

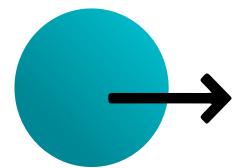

# **CANADA**

# Winnipeg data center

Canada

Winnipeg

Pneumatic baffles, ventilation system

**Building heating** 

Nearby

Quebecor

#### Technology

- Waste heat is sent to the nearby offices of a local newspaper.
- The company moved a second duct from the exhaust air plenum to the intake duct of the editorial office on the upper floor. The process is controlled by pneumatic baffles that open and close depending on readings from thermometers in the channels.

# **QScale Q01 Campus**

Canada

Agricultural use and building heating

Quebec

96 MW

QScale, Energir Development

- QScale is specifically designed to recover all IT systems waste heat.
- This sustainable colocation infrastructure is designed for high density hardware such as machine learning, artificial intelligence and supercomputing.
- Total campus IT capacity is 96 MW IT Load.
- QScale is powered by renewable energy at 99.5 %.
- Agriculture and industrial space heating projects are underway.
- The facility is located nearby existing greenhouses and over 100 hectares of agricultural land.
- Potential to produce 2 800 tons of berries and 80 000 tons of tomatoes.
- Use of waste heat in summer for drying grain and revitalization of surrounding agricultural land.

#### **Business**

- A second Campus at Ecoparc Saint-Bruno-de-Montarville in Montreal is planned, QScale is also scouting several additional location to expand.
- QScale is scouting location based on clean energy availability and heat recovery potential.

#### Communication

QScale announced its partnership with Energir in March 2023 and its first Anker customer, HPE, in May 2023.

#### Others

QScale Q01 Campus is designed into 8 phases. As of 2023, Phase 1 is operational and Phase2 is under construction.

# **JAPAN**

# **White Data Center Project (WDC)**

33 °C

Snow melt water, waterpool

Right next to the data center

Water pipes

≝ 2021

Image source: [360]; Sources: [361–368]

#### **Technology**

- A data center in northern Hokkaido Island is cooled with snow melt water and uses its waste heat to run an eel farm. A heap of snow is piled up on the data center site in winter, which cools the data center with the help of antifreeze, which circulates in a line from the heap to the data center. The snow pile is covered with insulating materials (wood chips and earth) in summer or warmer periods, so it lasts for up to a year. This can save 20 % of the energy costs of the data center.
- Currently 20 server racks are in operation, but there are already plans to open a second data center with 200 server racks by the end of 2022. The racks of the have a power density of 2 kVA, while they should be 5 kVA in the new DC. This results in an IT power of 40 kVA or 1000 kVA.
- After the data center has been cooled, the water has a temperature of 33 °C, which the
  company says is ideal for agriculture and aquaculture, including eel farming. For this
  purpose, the WDC imported 1700 glass eels (young eels) and will breed them in tanks in
  the data center. During its tenure as a research project, WDC studied various agricultural
  options for this warmth, including abalone, sea urchins, Japanese mustard spinach, cherry
  tomatoes, and other produce.

#### **Business**

- In cooperation with the city of Bibai, 6,000 eels have been bred in warm meltwater since November 2021. Often affected by heavy snowfalls, Bibai is working with the WDC on the possibility of using the snow collected by the city's snowplows as pre-cooled water for the servers and as a freshwater source for the eels.
- The pools are kept at 27 °C all year round. WDC expects to ship about 300,000 eels, which will be farmed on-site for seven months until they reach a commercial weight of 250 g.

#### **Communication**

From 2014 to 2019, the city implemented the "White Data Center" project, supported by the Japanese research organization NEDO, to show that snow can be stored in winter and used to cool a data center all year round.

#### Other

• The implementation of this method at other locations will be difficult because there are few places that meet the necessary conditions.

# **Tomorrow Water Project**

On one property

Common water and energy flows

Seoul, Jungnang

Process heat - water treatment

Tomorrow Water, Arcadis

#### **Technology**

 Co-flow idea: combine sewage treatment plants, biogas plants and data centers in one place and use AI to increase the efficiency of the entire process across the entire value chain.

#### Law

**E** 

 After examining the patents, Arcadis plans to collaborate on possible projects in the USA.

#### **Business**

- Build data centers on the same property as wastewater treatment plants so that both can share water and energy streams.
- Data center uses treated water.
- Wastewater treatment plant uses waste heat from the data center.
- BKT, has built a Waste Water Treatment Plant (WWRF) in Jungnang, Seoul, South Korea that uses Tomorrow's Proteus biofiltration system in place of settling tanks.

#### Communication

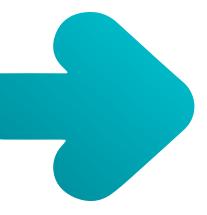

- According to Tomorrow Water, wastewater treatment plants could be built much smaller if large clarifiers were replaced with the Proteus biofiltration system. These facilities are typically located in urban areas that are attractive to edge data centers, which Tomorrow says could be co-located, where they can contribute waste heat to reduce the energy demands of the water treatment systems by heating the biological systems and drying them contribute to the mud.
- "Combining data centers and wastewater treatment plants will help reduce wastewater discharges, balance drinking water needs and provide triple benefits for water-stressed regions. We're excited to partner with Tomorrow Water to explore how the co-flow process can work together projects that improve the quality of life," said Ufuk Erdal, senior vice president and director of water reuse at Arcadis.
